

Below there are multiple job titles and job descriptions. Match each title to the description you think it represents.

I work for a government agency and make sure everyone on the water is following the law! I usually am driving a boat and check up on recreational boaters to make sure they have proper permits, are catching legal sized fish, and are practicing proper boating responsibilities. My job is important to ensure everyone on the water is safe and our environment is protected.

I have loved art and the ocean since I was a little kid. After I graduated college, I became an entrepreneur and started my own business. I love taking photos of big marine animals such as sharks and whales. I love selling my work to other ocean lovers and spreading environmental awareness through my art.

I get to work on the water every single day! I take people snorkeling, kayaking, and boating around Hawaii. My favorite part of my job is that I get to educate tourists on our unique ecosystems and create awareness about pressing environmental issues.

I work for a non profit organization. I live in the Florida Keys and I am SCUBA certified. I am in charge of restoring and planting new coral species at our barrier reef. My job is important because in order to have healthy ecosystems, we need to make sure there is plenty of healthy coral coverage. Planting coral is a tedious and time consuming job but, I get to spend most of my days in the ocean!

My job requires me to have a phone on me at all times, you never know when an animal could be in trouble! I went to college and studied mammalogy and now I work for a non profit organization. My main duties include helping animals in need and curing them of any sickness or injuries they may have. My job is rewarding because many times, I can nurse an animal back to health and release it back into the wild.

I work for an organization that fights for change! I am constantly trying to convince our government leaders to create stricter regulations to combat climate change, illegal fishing, and pollution. I hope to influence legislators in order to create a healthier ocean.

I have a passion for educating children about our earth. At work, I am in a classroom and teach students all about our ocean and why it is so important to protect it. I hope to inspire the next generation of marine biologists.

I work at a University in California. I work in a lab and am studying the effects plastic has on bony fish. Everyday, I dissect fish and look at their organ tissue underneath a microscope. I hope to write a scientific journal to give others information on plastic and how it is hurting our ecosystems.
